

Low Risk Web Sites

Charlotte Badger recommends that organizations.

1. Leverage global cloud service providers for their web sites.
2. Use static html web site pages.

- 1 By leveraging global cloud service provider platforms an organization gets access to secure services that have been built with budgets and economies of scale that are beyond reach of the typical organization. The cloud service provider's reputation is at stake.
- 2 Static html web site pages have no code to attack. They aren't hosted by traditional web or application servers so aren't exposed to the vulnerabilities associated with those environments.
